

What can be expected from this technology

Control infectious disease risk and solve the problem of infectious disease in areas with poor sanitary conditions

Threat of viruses throughout the year
Risk of new viruses emerging

Pandemics caused by the movement of people and goods

Limitations of medical treatment and vaccines

It is increasingly important to strengthen **the body's natural immunity** to fight viruses in the course of daily life.

What is immunity?

A mechanism for eliminating viruses, bacteria and other pathogens through both innate and acquired immunity

First type of immunity: innate immunity

- An immune response mechanism that people are born with
- Relays information on the enemy to acquired immune cells
- Its offensive power is weak, but its response is immediate (several hours)
- The innate immune system does not retain any memory of its targets, and simply attacks the enemy at hand

Second type of immunity: acquired immunity

- Acquired immune response
- Attacks enemies that breach innate immunity
- Is powerful but takes a few days to kick in
- Retains memory of the target (response is immediate from the second time onwards)

Immunity and food

Dietary habits greatly affect immunity

Lactic acid bacteria are known to be closely linked to immunity

Relationship between immunity and daily life

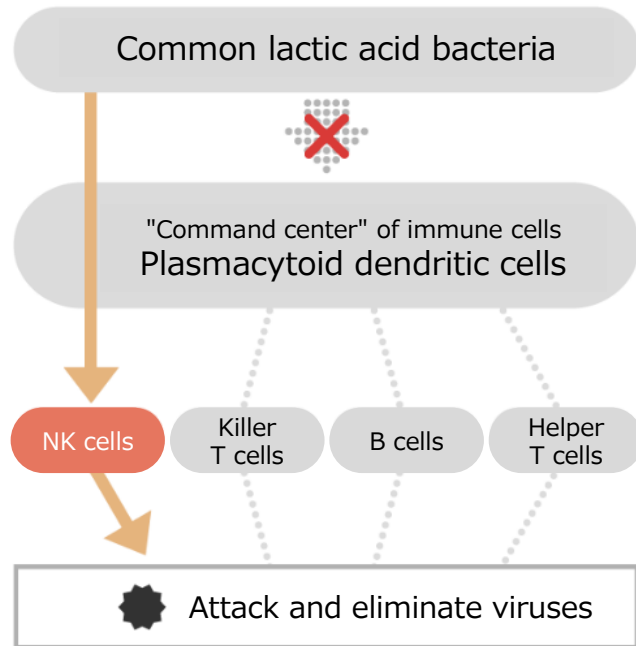

Food ingredients known to be associated with immunity

Background of this technique

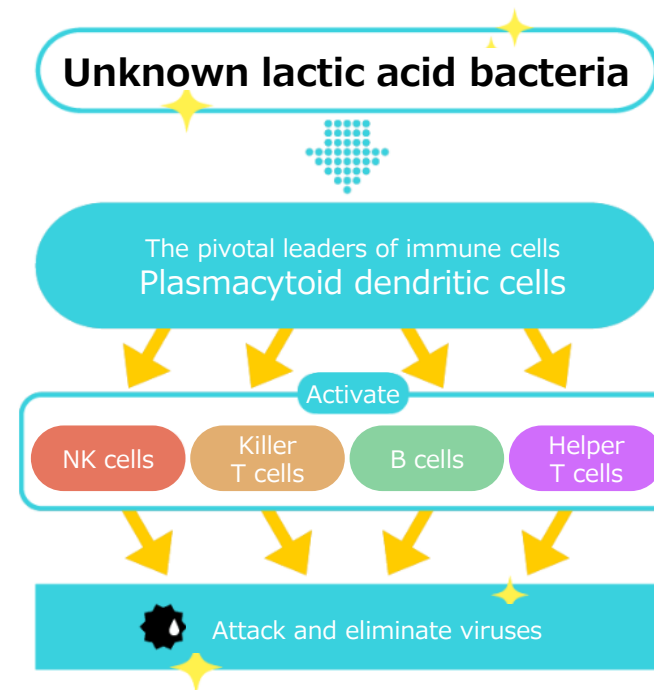

In the past, the accepted knowledge in immunology was that lactic acid bacteria activate only some immune cells (NK cells).

Accepted knowledge in immunology

Activate only some cells

Kirin's idea

Activates all immune cells

Is it possible that there may be lactic acid bacteria capable of activating the control tower?

*Blood 2009;113:4232-4239. Human plasmacytoid dendritic cells are unresponsive to bacterial stimulation and require a novel type of cooperation with myeloid dendritic cells for maturation

About this technology

Ingestion of "*Lactococcus lactis* strain Plasma " reduced the risk of influenza and colds

We asked 200 people to consume either a milk-based drink containing "*Lactococcus lactis* strain Plasma" or a milk-based drink without "*Lactococcus lactis* strain Plasma" every day for 10 weeks, and investigated the effects on their physical condition.

Volunteers

200 people

100 people

100 people

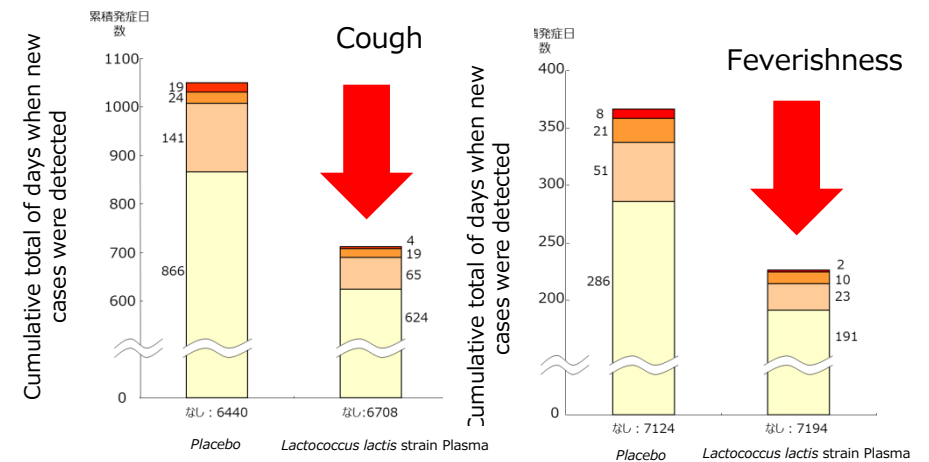

Milk-based drink containing *Lactococcus lactis* strain Plasma

Milk-based drink that does not contain *Lactococcus lactis* strain Plasma

Number of people suffering from influenza/cold

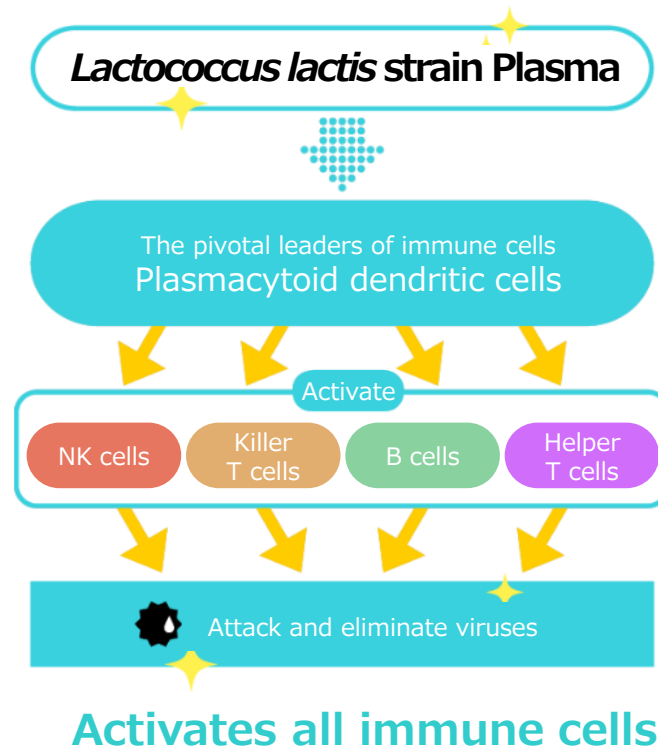

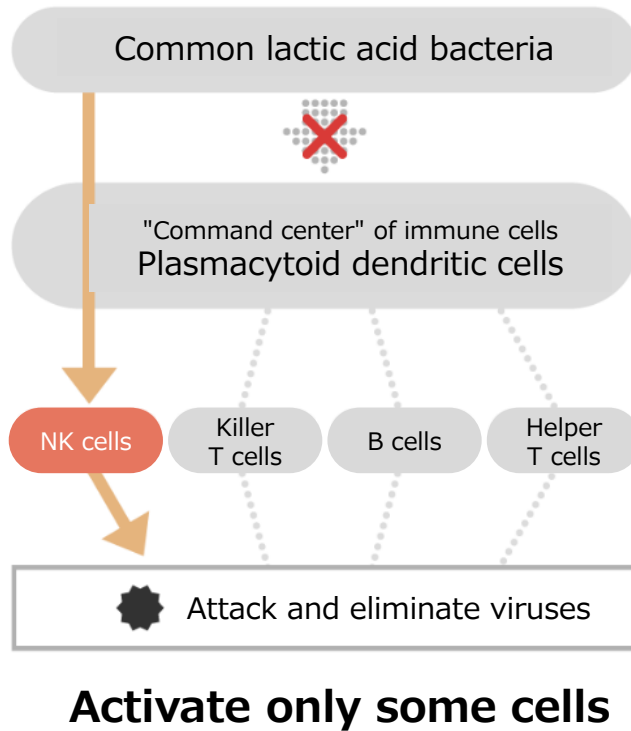

Influenza-like subjective symptoms

Uniqueness of this technique

Lactococcus lactis strain Plasma are highly rated by experts for their unique ability to activate the "control tower," with numerous scientific papers published

32

Future potential

Since *Lactococcus lactis* strain Plasma activate the "control tower," they can be expected to be effective against various viruses

Effect on rotavirus (non-clinical study)

A model of rotavirus infection was used to evaluate the effects of *Lactococcus lactis* strain Plasma. Compared to the physiological saline group, the *Lactococcus lactis* strain Plasma group showed an improvement in fecal rotavirus levels

Effect on rotavirus (non-clinical study)

Dendritic cell supernatant stimulated with *Lactococcus lactis* strain Plasma was added to cultured cells infected with dengue virus. This was found to limit virus growth
